

## AI Tools

The quality of an UI I could produce wouldn't be the best, it wasn't until the last semester that I worked with a decent good looking UI, before that the interfaces were not that much requested in the projects assigned in the faculty, once with the learning of web development I did understand a lot better the way an UI works and after that I know I could produce one, but honestly for the moment it wouldn't be that easy and the result not that good looking.

It is easy to use the AI Tool, the hard part it's to get what you really want, the result you get might be pretty usable, but it's practically impossible to get what you need, it sure would save a lot of time and effort but it doesn't solve the whole problem, you still need to adapt the result and improve it to finally get the UI you really want. When I used an AI Tool to produce an UI I got something to start with, but it wasn't even close to what I was looking for, the result doesn't include the usability attribute that deeply, it is usable but in the most basic way.

I don't think the UX role will change a lot, even if the AI tools get better, the result they give will always have the chance to be improved, it needs to be analyzed and its quality verified.
